TODO — Automatic Sonification Tool

Research & Use Case

- [ ] Describe the complete use case and intended workflow.
- [ ] Research related work and existing automatic sonification tools.
- [ ] Investigate whether an entire article/document can be processed at once.
- [ ] Brainstorm possible features for the tool.
- [ ] Consider features that support the specific workflow, e.g. saving a sonification for use at a later point while keeping the sonification consistent.
- [ ] Define the scope of the tool.
- [ ] Decide which features should actually be implemented.
- [ ] Create a complete design sketch covering the possible workflow and feature options.

Technical Investigation

- [ ] Investigate how the tool could be implemented as a browser-based tool / browser extension.
- [ ] Research the technical requirements and constraints.
- [ ] Investigate possible storage options.
- [ ] Identify relevant browser and technical limitations.
- [ ] Consider how saved sonifications/configurations could be stored and reused.

Research Question & Study

- [ ] Develop and narrow down the research question.
- [ ] Research experience sampling as a possible evaluation method.
- [ ] Determine how experience sampling could fit the intended workflow.
- [ ] Develop the study design based on the research question and prototype.

Exposé

- [ ] Write the exposé based on the literature review, use case, planned tool, research question, and study design.
